

THEORY OF COMPUTATION - HOMEWORK 1

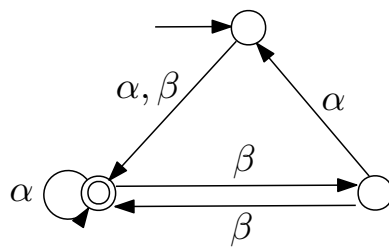

Assigned 2018.10.17. Submission deadline 2018.11.06 (for only those who want their homework to be marked).

Problems

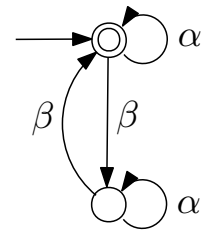

1. Provide a real-life example of a finite automaton. Describe the states and state transitions. Write down the automaton model $\mathbf{G} = (Q, \Sigma, \delta, q_0, Q_a)$.

2. Let the alphabet be $\Sigma = \{\alpha, \beta\}$, and consider a language $L = \{(\alpha\beta)^n \mid n = 0, 1, 2, \dots\}$. Design a finite automaton \mathbf{G} to accept L , i.e. $L(\mathbf{G}) = L$.

3. Consider the two finite automata $\mathbf{G}_1, \mathbf{G}_2$ displayed in the figure below. Derive a finite automaton \mathbf{G} that accepts $L(\mathbf{G}_1) \cup L(\mathbf{G}_2)$.

\mathbf{G}_1

\mathbf{G}_2
